Item	Value
Course	CSC13002 Introduction to Software Engineering – PA1-2026
Group	Group 07 – IntroSE 24C02
Product type	Responsive web application (working name: Froodge)

1. Introduction

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

1.1 Problem

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Food waste starts at home. The UNEP Food Waste Index Report 2024 estimates that households wasted about 631 million tonnes of food in 2022, or 79 kg per person. In Vietnamese cities, families and students usually shop once or twice a week, put everything into one shared fridge, and soon lose track of it.

#	Problem	Result
P1	Nobody knows exactly what is in the fridge or when it expires.	Food spoils unnoticed and money is wasted.
P2	"What should we cook today?" has to be answered every day.	People repeat dishes or buy more instead of using what they have.
P3	Recording groceries by hand takes too long.	Users stop updating their inventory after a few days.
P4	Household members do not share one view of the food at home.	Duplicate purchases and missing ingredients.

1.2 Our Solution

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Our web app turns the household fridge into a **shared, always up-to-date food inventory**. Users add groceries quickly by **photographing a bill or the food itself**: AI identifies each item and suggests its quantity and estimated expiration date, and the user confirms before saving. The app then warns the household about food that should be used soon, **recommends recipes that use those items first**, and **creates meal plans** with nutritional information.

Household users and community participants work in one loop: household users keep the fridge up to date and cook from it, while community participants share and discuss recipes that feed back into the recommendations.

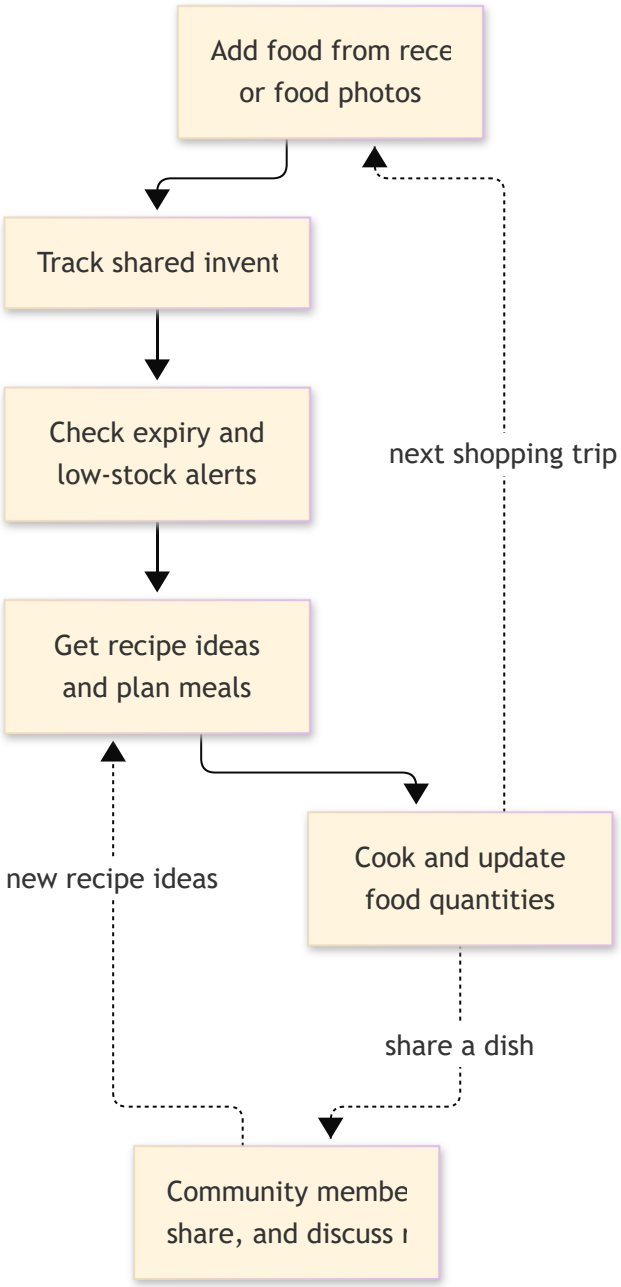

Figure 1. Household food and recipe workflow.

Administrators manage user accounts and review activity statistics to keep the app safe and understand how it is used.

1.3 Value

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

For	Value delivered
Households	Less food and money wasted; a quick answer to "what to cook today"; one shared view of the fridge and meal plan.
Community participants	A place to find, share and discuss home-style recipes.
Administrators	Tools to manage accounts and understand how the app is used.

1.4 What Makes It Different

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Compared with the apps in our survey (Well-Stockd and SuperCook):

1. **Fast input:** one bill or food photo can add many items, and every AI suggestion is reviewed by the user before it is saved.
2. **Alerts that lead to action:** soon-to-expire food is linked directly to recipes that use it.
3. **Local focus:** the workflow is designed around Vietnamese foods, units, recipes and bill formats. We will check this with real users before claiming it as an advantage.
4. **Household-first:** members share one inventory and meal plan, with roles managed by the household.

2. Target Users and Environments

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

2.1 Target User Segments

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Segment	Characteristics	Why the app fits	Priority
Urban families	Parents aged 28–45; weekly supermarket trips; one main meal planner	Largest food volume; need shared planning	Primary
Students and young workers sharing a flat	Aged 18–27; tight budget; 2–5 people share one fridge	Need to know what is at home; cheap meals from leftovers	Primary
Busy singles and couples	Shop irregularly; cook a few times a week	Forget food easily; benefit most from alerts	Secondary

2.2 Actors

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Actor	Description	Main goals
Normal / Household User	A registered user who manages the food of one household. Their household role decides whether they can manage members.	Know what is in the fridge, use food in time, plan meals.
Community Participant	A registered user who searches, posts and comments on recipes. The same account can also be a household user.	Find and share recipes.
Administrator	A user with administrative permissions.	Manage user accounts; view activity statistics and insights.

Secondary (system) actors: the AI services (bill OCR, food image recognition, recommendations, meal planning) and the e-mail service.

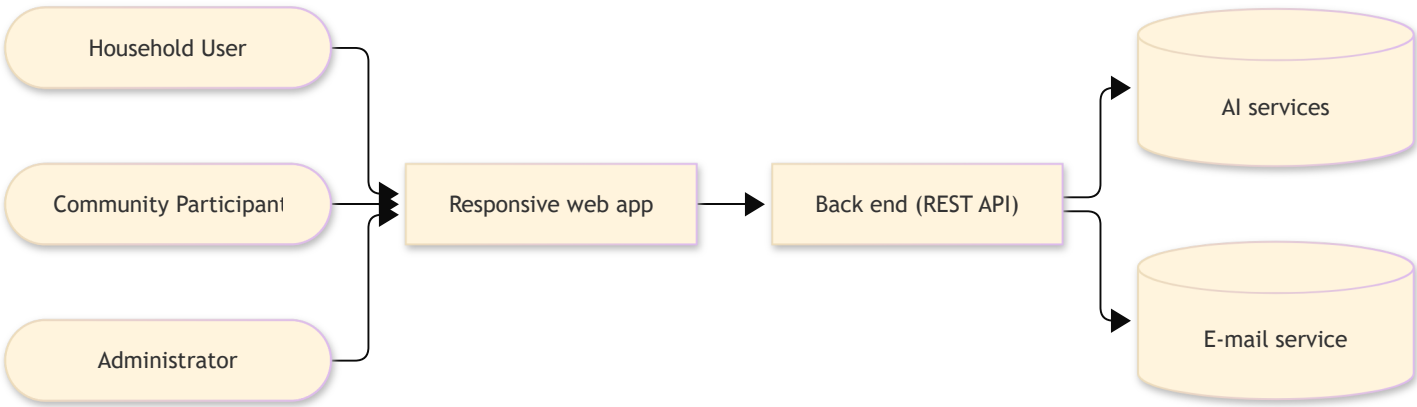

Figure 2. Application actors and supporting services.

2.3 Usage Context

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

When / where	Who	Typical task	Design implication
At home after shopping	Household User	Photograph the bill, confirm items	Camera upload and a review screen usable on a phone
Before cooking	Household User	Check "use soon" items, pick a recipe	Recommendations reachable in two taps from the home page
Weekend evening	Household User	Plan next week's meals	Clear weekly view; edit before saving
Any time, on phone or laptop	Community Participant	Search, post or comment on recipes	Fast search; simple post form with photos
At a desk	Administrator	Manage accounts, read statistics	Desktop tables, filters and dashboards

2.4 Environments

Performed by: Cao Tiến Thiên · **Reviewed by:** Phan Tuấn Phong · **Edited by:** [None]

Aspect	All actors
Application	One responsive web application over HTTPS; no native mobile app this semester
Devices	Smartphones (mobile browser), laptops, desktop computers and tablets; layouts from 360 px wide
Browsers / OS	Latest two versions of Chrome, Edge, Firefox and Safari on Android, iOS, Windows, macOS or Linux
Device permissions	Camera or photo library, used through the browser's standard upload, for bills and food photos
Connectivity	Internet connection required (4G or Wi-Fi)
Notifications	In-app notifications and e-mail for soon-to-expire and low-stock food
Languages	Vietnamese (default) and English
Accessibility	Text contrast ≥ 4.5:1; status shown by colour **and** text; keyboard-navigable forms

Aspect	All actors
Server side	Back end planned as Node.js + Express with TypeScript; database and AI provider to be decided

3. Key Features

Performed by: Nguyễn Cao Thông · **Reviewed by:** Cao Tiến Thiên · **Edited by:** [None]

3.1 Accounts and Households

Users can register, sign in and out, and manage their personal information, password, and avatar. They can view activity statistics to understand how they use the app. Household members can be invited or removed, and their roles determine who can manage shared food information and meal plans.

3.2 Food Inventory and Shopping

Users can record each food item's quantity, storage location, and estimated expiration date, then update the quantity after shopping, cooking, or discarding food. Receipt OCR and food photo recognition can suggest entries that users review before saving, reducing the time needed to maintain the inventory. The app highlights food nearing expiration or running low and suggests purchases for low-stock items or planned meals, helping households use food in time and prepare shopping lists.

3.3 Recipes and Community

Users can browse and search recipes by name or ingredient and check the required ingredients before deciding what to cook. Community participants can publish recipes, edit or delete their own posts, and comment on other people's recipes. This gives households a wider range of meal ideas and lets members exchange cooking tips and feedback.

3.4 AI Cooking Assistance

The app compares recipe ingredients with the household inventory and recommends meals users can make or nearly make. It prioritizes food nearing its estimated expiration date and identifies missing ingredients, helping users choose meals that make better use of what they have. Users can request and adjust weekly or monthly meal plans with basic nutritional information where reliable recipe data is available, making it easier to plan meals and identify what to buy.

3.5 Administration

Administrators can manage user accounts to address account-related issues. They can review platform activity statistics to see how people use the application. Together, these tools help administrators oversee the service and identify areas that may need attention.

4. Key AI-Powered Features

Performed by: Nguyễn Cao Thông · **Reviewed by:** Cao Tiến Thiên · **Edited by:** [None]

4.1 AI-Assisted Food Entry

Users can upload a receipt or food photo instead of entering every item manually. OCR reads receipt text to identify possible food items, while image recognition identifies food in photos. The app suggests quantities and estimated expiration dates, and users review and correct these suggestions before saving them to the household inventory.

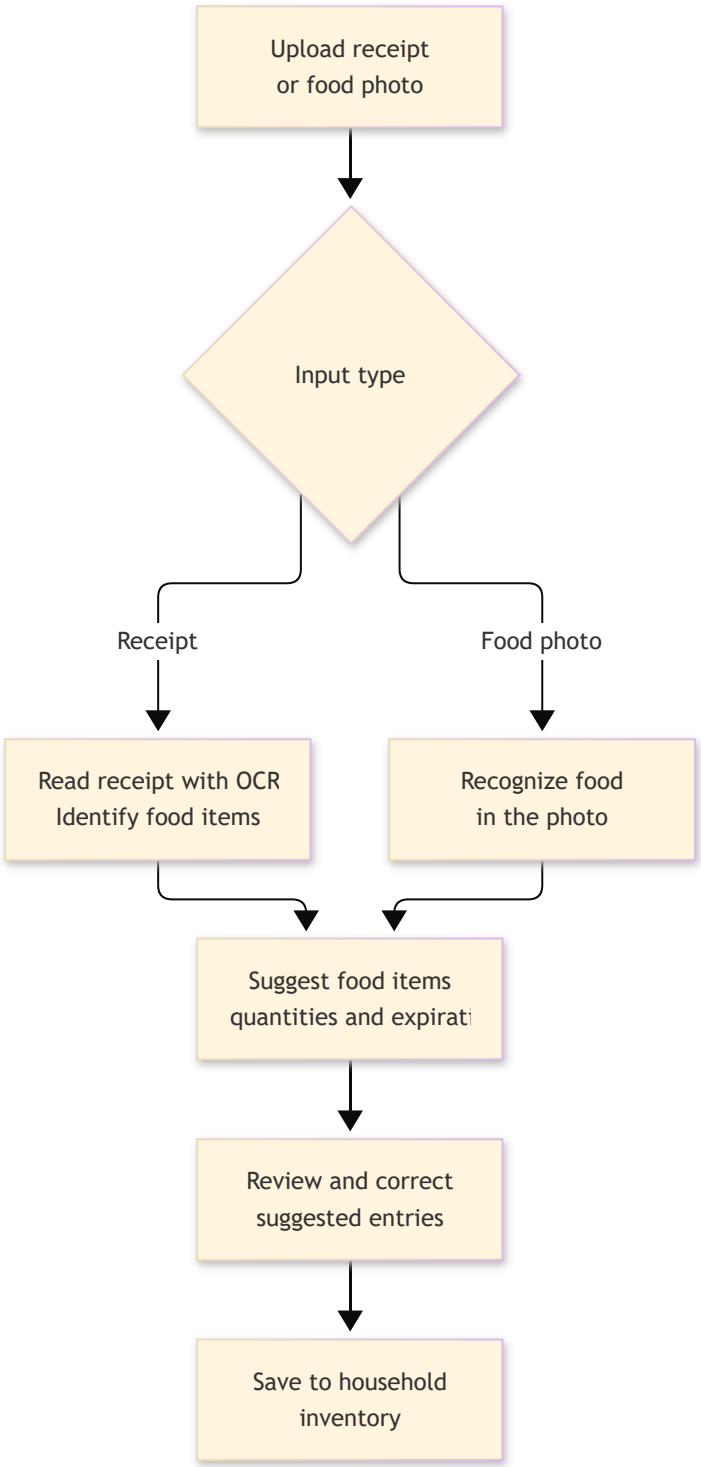

Figure 3. AI-assisted food entry workflow.

4.2 Inventory-Aware Recipe Recommendations

The app compares recipe requirements with the household's recorded food and quantities. It prioritizes recipes that use ingredients nearing their estimated expiration dates, identifies missing ingredients, and explains each suggestion. Users decide which recipe to make; choosing one does not automatically change their inventory or shopping list.

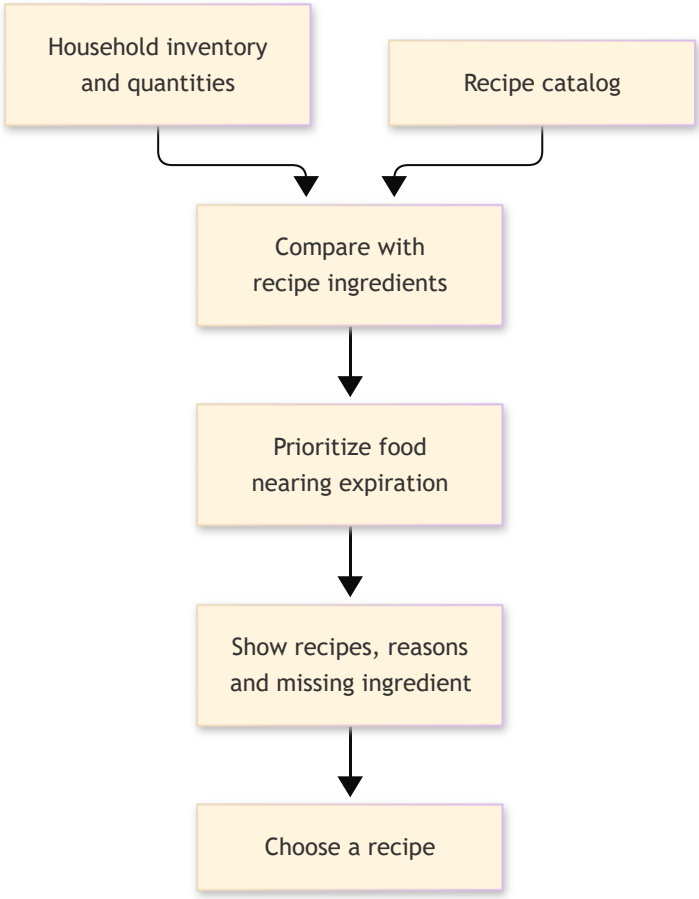

Figure 4. Inventory-aware recipe recommendation workflow.
